

DE4: Delivery Health 360 - Command Center for Delivery Visibility Through an Intelligent Delivery

Category

Delivery Experience / Delivery Excellence / Executive Visibility

Challenge Overview

How might Relevantz create a unified, real-time command center that provides complete visibility into delivery execution across engagements, projects, teams, and sprints?

Participants are invited to design an Intent-Driven System (IDS) that transforms fragmented delivery data into actionable intelligence for delivery teams, account leaders, and executive stakeholders.

The solution should consolidate delivery signals from multiple systems and provide a single source of truth for sprint health, release health, project health, and engineering effectiveness.

This is not a dashboard challenge. It is a **delivery intelligence and decision orchestration challenge**.

Business Context

Relevantz manages multiple engagements across customers, domains, delivery models, and technology ecosystems. Each project generates delivery data across numerous platforms, including work management tools, source code repositories, quality systems, and communication channels.

Today, delivery visibility is fragmented.

Engagement Managers and Delivery Managers manually consolidate information from disparate sources to create sprint scorecards and project health reports. Leadership teams often receive lagging indicators that require significant effort to compile and interpret.

As a result:

- Delivery risks are identified late
- Teams spend excessive effort creating reports instead of acting on insights

- Leadership lacks a consistent, real-time view of delivery health
- Engineering effectiveness is difficult to measure consistently across projects

There is an opportunity to establish a centralized command center that continuously monitors delivery signals and proactively guides teams toward better outcomes.

Current State and Key Frictions

Manual Delivery Quality Tracking

- Sprint quality metrics are maintained using spreadsheets and scorecards
- Data collection and reporting are manual and time-consuming
- Metrics vary across teams and projects

Fragmented Tool Ecosystem

- Delivery data resides across multiple systems, including:
 - JIRA
 - Azure DevOps (ADO)
 - Git repositories
 - Test management tools
 - Communication platforms
- Customer-owned tools create additional complexity and access challenges

Limited Executive Visibility

- Delivery insights are often retrospective rather than real-time
- Leadership lacks a unified view across projects and accounts
- Teams spend significant effort creating status reports manually

Engineering Effort Visibility Gaps

- No standardized method exists to understand engineering contribution across roles
- Managers manually gather data to assess delivery effectiveness
- Individual and team insights are difficult to correlate with delivery outcomes

Disconnected Metrics

- Sprint metrics, release metrics, and project metrics are not connected
- Operational signals are not translated into actionable recommendations
- Teams lack contextual understanding of delivery health drivers

Vision Statement

Relevantz aims to build an intelligent Delivery Command Center that serves as the organization's single pane of glass for delivery execution.

The system should function as a **Delivery Intelligence Layer**, enabling stakeholders to understand delivery health in real time, predict emerging risks, and take informed action.

Personas and Ecosystem

Executive Personas

- Executive Leadership
- Business Unit Leaders
- Delivery Governance Teams

Delivery Personas

- Client Partners (CP)
- Engagement Managers (EM)
- Delivery Managers (DM)
- Project Managers
- Scrum Masters

Engineering Personas

- Engineers
- Quality Engineers
- Business Analysts
- Architects
- Technical Leads

Supporting Personas

- PMO Teams
- Workforce Management Teams
- Delivery Excellence Teams

Participants should design solutions that address the unique information needs of each persona.

Challenge Objectives

Participants should design a system that enables Relevantz to:

Create a Unified Delivery View

- Consolidate delivery data from multiple enterprise and customer environments
- Provide a single source of truth for delivery health
- Eliminate manual reporting efforts

Measure Delivery Effectiveness

- Track and standardize delivery quality metrics across projects
- Connect engineering activities to delivery outcomes
- Enable benchmarking across teams and engagements

Enable Proactive Decision-Making

- Detect risks and anomalies early
- Predict delivery issues before they impact outcomes
- Recommend corrective actions

Improve Executive Visibility

- Provide real-time insights tailored to stakeholder needs
- Support portfolio-level decision-making
- Enable data-driven governance

Desired Future-State Journey

1. Continuous Data Ingestion

The system continuously collects signals from:

- JIRA and Azure DevOps
- Git repositories
- CI/CD pipelines
- Test management platforms
- Communication and collaboration tools
- Delivery scorecards and project systems

2. Delivery Health Computation

The system automatically calculates and contextualizes metrics across multiple levels.

Sprint Health

Examples may include:

- Commitment reliability

- Velocity trends
- Sprint predictability
- Spillover rates
- Defect leakage
- Team capacity utilization

Release Health

Examples may include:

- Release readiness
- Defect density
- Test coverage
- Deployment frequency
- Change failure rates
- Mean time to recovery

Project Health

Examples may include:

- Schedule adherence
- Delivery predictability
- Budget utilization
- Resource stability
- Customer sentiment
- Risk and escalation indicators

3. Engineering Effectiveness Intelligence

The system should consolidate contributions across engineering roles, including developers, quality engineers, and business analysts.

Potential insights may include:

- Delivery throughput trends
- Pull request activity
- Review turnaround time
- Defect trends
- Test execution metrics
- Work distribution patterns
- AI-assisted development adoption

Participants should carefully consider how productivity is measured to ensure fairness, context, and role relevance.

The objective is to understand **engineering effectiveness**, not simply engineer activity.

4. Personalized Command Center Experiences

Different personas should receive role-specific views and recommendations.

Examples:

- Executives require portfolio-level insights
- EMs and DMs require project-level operational visibility
- Engineers require actionable team-level guidance

5. Predictive Insights and Recommendations

The system should:

- Identify early indicators of delivery risk
- Predict potential sprint or release issues
- Recommend corrective actions
- Surface best practices from similar projects

6. Closed-Loop Delivery Improvement

Insights generated by the command center should continuously improve delivery outcomes by influencing:

- Sprint planning
- Release planning
- Workforce allocation
- Learning interventions
- Risk management processes

Participant Considerations

Intent Understanding

- How does the system determine what each stakeholder needs to know?
- How does it prioritize information based on role and context?

Metric Design

- Which metrics truly indicate delivery health?
- How are metrics normalized across projects, customers, and methodologies?

Engineering Effectiveness

- How can contribution be measured fairly across different roles?
- How can quality and outcomes be emphasized over activity volume?

Predictive Intelligence

- Which delivery signals indicate future risks?
- How can historical data improve forecasting accuracy?

Experience Design

- How can stakeholders move from visibility to action?
- How can information overload be minimized?

Governance and Trust

- How are customer-owned systems integrated securely?
- How is metric transparency ensured?
- How are privacy and ethical considerations addressed?

Constraints and Assumptions

- Access to customer-owned tools and environments may be restricted
- Delivery data may be incomplete or inconsistent across projects
- Teams may use different methodologies and toolsets
- Metrics require contextual interpretation
- Human judgment remains essential for performance and delivery decisions

Dependencies

- JIRA
- Azure DevOps
- Git repositories
- CI/CD platforms
- Test management tools
- Communication platforms
- Existing delivery quality scorecards
- Customer-owned delivery systems

Success Measures

Visibility

- Increased real-time visibility into delivery health
- Reduction in manual reporting effort
- Improved consistency of delivery metrics

Operational Effectiveness

- Faster identification of delivery risks
- Improved sprint and release predictability
- Reduced delivery escalations

Engineering Excellence

- Better understanding of engineering effectiveness
- Increased focus on quality outcomes
- Improved collaboration across teams

Leadership Outcomes

- Improved portfolio-level decision-making
- Enhanced governance and oversight
- Increased confidence in delivery forecasts

What Exceptional Solutions Might Demonstrate

Exceptional solutions will demonstrate:

- A true single pane of glass for delivery execution
- Real-time visibility across sprint, release, and project health
- Fair and contextual engineering effectiveness insights
- Predictive delivery intelligence and recommendations
- Seamless integration across customer and internal ecosystems
- Role-based experiences tailored to different stakeholders
- Continuous feedback loops that improve delivery outcomes

The most compelling solutions will transform delivery reporting from a retrospective activity into a proactive capability, enabling Relevantz leaders to answer three critical questions at any moment:

"Are our teams healthy?"

"Are our releases on track?"

"What actions should we take next to improve delivery outcomes?"
